4-(6) Anti-skating Adjustment	4	10. Accessories List	Back cover
4-(7) Pulley Height Adjustment	4		

Warning: When replacing the parts marked with Δ , be sure to use the designated parts to ensure safety.

CHECKING YOUR LINE VOLTAGE (For U.S. Military Market and Other Countries)
Before inserting the power plug, please check this setting to see that it corresponds with the line voltage in your area. If it doesn't, be sure to adjust the voltage selector switch to the proper setting before operating this equipment. The voltage selector switch is located the inside chassis.

CAUTION Before selecting the "Voltage selector switch" to proper voltage disconnect the power plug.

1. Specifications

MOTOR AND TURNTABLE

Drive System: Belt drive system
Drive Motor: 4 poles synchronous motor
Speeds: 33-1/3 and 45 rpm
Wow and Flutter: Less than 0.075% (DIN)
Signal to Noise Ratio: Better than 66 dB (DIN-B)
Platter: 12-inch(30cm) diameter die-cast aluminium alloy

TONEARM

Type: Statically-balanced straight tubular arm with tracking force dial of 0.1 gram steps
Effective Arm Length: 220mm
Overhang: 15mm
Applicable Tracking Force Range: 0 to 3 grams

CARTRIDGE (EXCEPT FOR U.S.A)

Type: Dual magnet, MD1038
Stylus: 0.6 mil diamond, DT-38 or ATN-3410 By AUDIO-TECHNICA

Optimum Tracking Force: DT-38
2.0 \pm 0.5 grams
Output: 2.5mV (1kHz)
Frequency Responce: 10 to 20,000Hz
Separation: Better than 25dB (1kHz)
Load Resistance: 47k ohms
Compliance: 25 x 10⁻⁶ cm/dyne

FEATURES

Tonearm lifter, Auto-return mechanism, Removable dust cover, Anti-skating device, etc.

GENERAL

Power Source: See page 8
Power Consumption: See page 8
Dimensions: 42 x 35 x 11.5cm (W x D x H)
(16.5 x 14 x 4.5 inch)
Weight (Net): 4.5kg (9.9 lbs)

2. Operation of Automatic Mechanism

Change cycle mechanism:

1. During playing, the notch of the main gear position relative to the turntable spindle gear is as shown in Fig. 1. As the projection is away from the engagement, the main gear does not rotate even though the turntable.
2. As playing proceeds, the trip slide moves toward the center of the turntable following the movement of the tonearm.
3. The engagement is very easy to move as it simply rests on the lower trip. On the music section of the record groove the engagement moves so slightly that it is returned by the tip of the projection. Consequently, the turntable spindle gear does not engage with the main gear and thus does not trigger the auto-return operation as shown in Fig. 2.
4. When playing ends and the pick-up cartridge enters the lead-out groove which is spaced out, the engagement advances more than it is returned by the projection. Because of this, the engagement is pressed by the projection as shown in Fig. 3, causing the main gear to turn and engage with the turntable spindle gear. Thus the change cycle is started.
5. During the return operation the engagement and lower trip which have moved are returned to their original position by the reject button coming into contact with the bottom of the lower trip. At this moment the switch lever operates with the help of the main gear cam, switching off the power just before the rotation should stop.

This completes the automatic cycle.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Tonearm lift and return mechanism:

1. When the main gear starts to rotate at the end of playing, the return lever rotates under the action of the main gear cam to press the elevator cam. The upward movement of the elevator cam is directly converted into movement of the elevator, lifting up the tonearm. (Fig. 4)
2. The tonearm is returned by the arm lever the end of which presses it as the main gear rotates.

3. Cartridge Replacement

1. Unscrew the connector screw to remove the headshell.
2. Remove the two long screws on the headshell which hold the cartridge. (Fig. 5)
3. Connect the lead wires of the headshell to the new cartridge, being careful to match the polarities correctly. Polarity and wire colors are as follows:
 White (+)L Red (+)R
 Blue (-)LE Green (-)RE
4. Attach the cartridge to the headshell squarely, and gently tighten the screws.
5. Set the cueing button to "DOWN", and then bring the stylus tip to the optimum position by sliding the cartridge back and forth. See 4-(1) Overhang Adjustment.
6. After attaching the cartridge, slide the headshell into the tonearm. Tighten the connector screw.
7. Be sure to adjust the tracking force and lead-in position after replacing the cartridge.

Fig. 5

4. Adjustment Procedures

The following adjustments should be performed only when replacing a cartridge or a headshell. Otherwise, no adjustment is required.

If necessary to replace a cartridge, usage of that headshell exclusive to this unit is recommended.

4-(1) Overhang Adjustment

To obtain optimum overhang, when mounting the cartridge, first align the cartridge's longitudinal axis with that of the headshell and position the cartridge so that the distance between the headshell's end face and the stylus tip equals 32mm as shown in Fig. 6.

Be sure to tighten the set screw after the adjustment. Errors within 1mm are negligible from a practical point of view.

Fig. 6

4-(2) Headshell Angle Adjustment

If the headshell is not horizontal and the stylus tip is not perpendicular to the record surface, loosen the lock screws using a small screwdriver and adjust the headshell unit the stylus tip is set at a right angle as shown in Fig. 7. Eye measurement is sufficient.

Be sure to retighten the screws after the adjustment is completed.

Fig. 7

4-(3) Tonearm Lifter Height Adjustment

Adjust the height of tonearm lifter with the adjustment screw so that the distance between the stylus tip and the surface of record is about 6mm when the stylus is elevated. Turn the height adjustment screw clockwise to lower, and counterclockwise to raise the tonearm lifter level. (See Fig. 8.)

Fig. 8

4-(4) Auto-return (Lead-out) Adjustment

When the pulley has been replaced for a different record or if auto-return functions early, adjust as shown in Fig. 9

- When change cycle starts too late, turn the screw counterclockwise with a screwdriver.
- When change cycle starts too early, turn the screw clockwise.

Fig. 9

4-(5) Tracking Force Adjustment

1. Set the anti-skating knob to the "0" mark on the dial.
2. Place an unwrapped disc onto the platter.
3. Remove the stylus cover from the stylus.
4. Release the tonearm clamp.
5. Turn the counterweight until the tonearm is balanced.
6. Stop turning the counterweight when the stylus tip is almost touching the disc surface.
7. Return the tonearm to the rest and clamp it.

8. Hold the counterweight at the adjusted position and turn the tracking force dial until the "0" mark is aligned with the index line on the tonearm weight shaft. Turn the counterweight in the A direction until the "2.0" mark on the dial is aligned with the index line.

Fig. 10-A

Fig. 10-B

Fig. 10-C

4-(6) Anti-skating Adjustment

Adjust the anti-skating force according to the cartridge used. Turn the anti-skating knob dial to the same number on the tracking force dial. Set the "2" of the Knob dial to the index Arrow since the L-A10 is provided with a spherical stylus except U.S.A.

Fig. 11

4-(7) Pulley Height Adjustment

When the pulley has been replaced for a different frequency, adjust the height of the pulley so that the belt is located in the middle of each section. If this is not done its correct speeds cannot be obtained and the speed change will not be smooth.

If the belt is in contact with the shift lever, the height of the pulley is not correct. Loosen the set screw and adjust the pulley vertically. (Fig. 12)

Fig. 12

5. Lubrication

Use quality mineral oil such as sewing machine oil on the motor shaft and turntable spindle.

* Motor shaft

5 - 6 drops once a month for heavy use.

1 - 2 drops every three months for normal home use.
